Notes: The voluntary nature of transmission for non-euro area countries (Eurostat Regulation) may lead to the non-availability of some results for those countries.

The calculations are based on the latest requirements set out in the amended ECB Guideline on external statistics.

Data revisions received in December 2023 for the indicated reference periods are reflected in the table.

#### Types of validations:

CS: counterpart sector (follows the same intuition as the reference sector type).

GEO2,3,4: geographical breakdown, e.g. the sum of the intra and extra-euro area/EU transactions should be equal to transactions vis-à-vis the RoW.

RS: reference sector (total economy (S1) should be consistent with the sum of the subsectors, i.e. S121, S12T, S13, S1P).

SIGN: verifies whether items that should have a positive sign are in fact positive.

**Table A.1.3.2**

Share of satisfied integrity rules/validations for the quarterly balance of payments

## Percentage of possible integrity rules

Notes: The voluntary nature of transmission for non-euro area countries (Eurostat Regulation) may lead to the non-availability of some results for those countries.

The calculations are based on the latest requirements set out in the amended ECB Guideline on external statistics.

Data revisions received in December 2023 for the indicated reference periods are reflected in the table.

Additional types of validations:

ACC: accounting item, e.g. the balance should be equal to credit minus debit.

CONS: time consistency (the sum of the monthly data should be equal to the data reported quarterly).

FUNC: functional category (equality between the financial account and its sub-account following BPM6 conventions).

IAI: international accounts item, e.g. the current account is equal to the sum of its components (goods, services, and primary and secondary income).

MAT: maturity classification, e.g. long-term and short-term maturities add up to all original maturities.

STR: instrument and asset classification, e.g. gross external debt is equal to the sum of its sub-components.

## Net errors and omissions

### Chart A.1.3.1

Average net errors and omissions relative to the average international investment position

As a percentage of the i.i.p.

- Q3 2020 to Q2 2023
- September 2020 to June 2023

Source: ECB.

## A.1.4 External consistency/coherence

### Coherence with foreign trade statistics

**Table A.1.4.1.**

Directional consistency for b.o.p. total goods and ITGS (merchandise trade)

#### As a percentage of the analysed period

(Q3 2020 to Q2 2023; as a percentage of the analysed period)

## Consistency with sectoral accounts

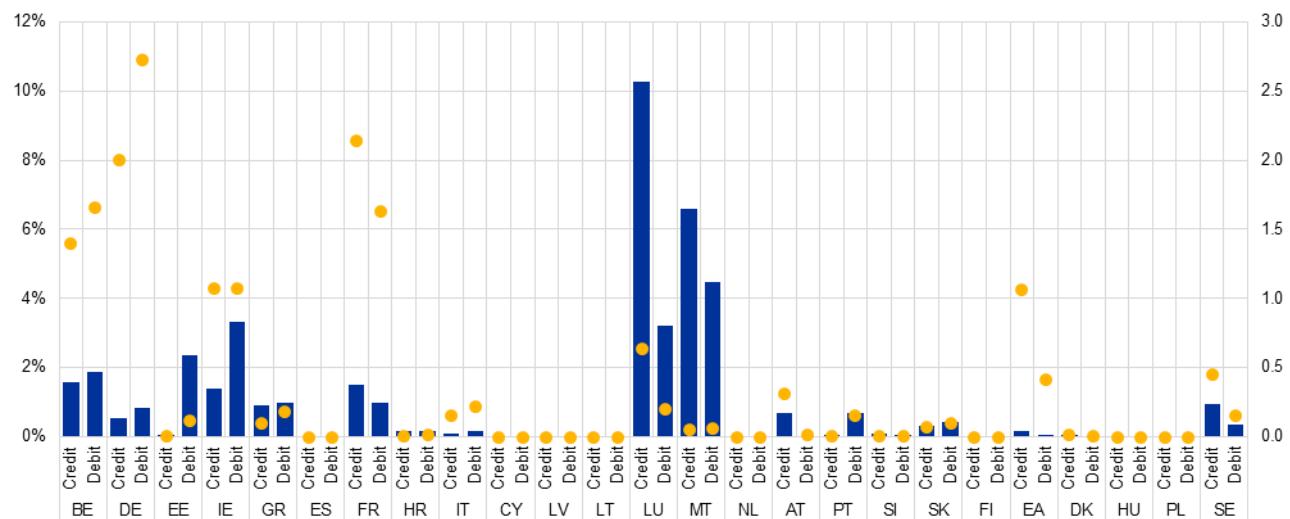

### Chart A.1.4.1

Discrepancies in goods between the b.o.p. and the RoW account

Average as a percentage of the respective b.o.p. account item, in EUR billions (right-hand scale)

(Q3 2020 to Q2 2023)

- Relative difference (left-hand scale)
- Absolute difference in EUR billions (right-hand scale)

Source: ECB.

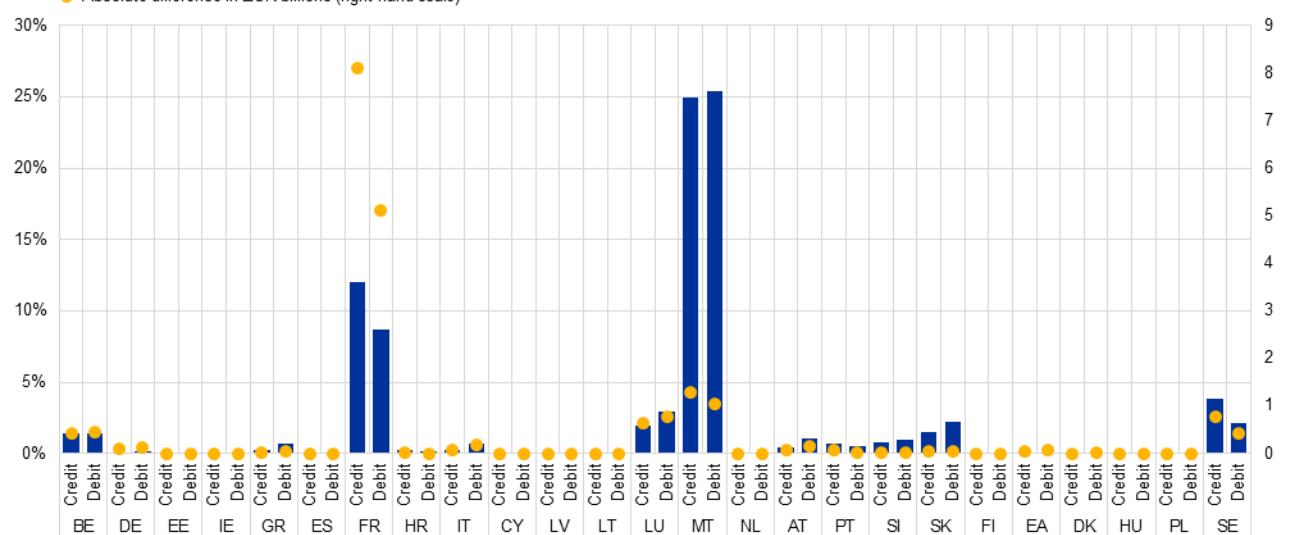

### Chart A.1.4.2

Discrepancies in services between the b.o.p. and the RoW account

Average as a percentage of the respective b.o.p. account item, in EUR billions (right-hand scale)

(Q3 2020 to Q2 2023)

- Relative difference (left-hand scale)
- Absolute difference in EUR billions (right-hand scale)

Source: ECB.

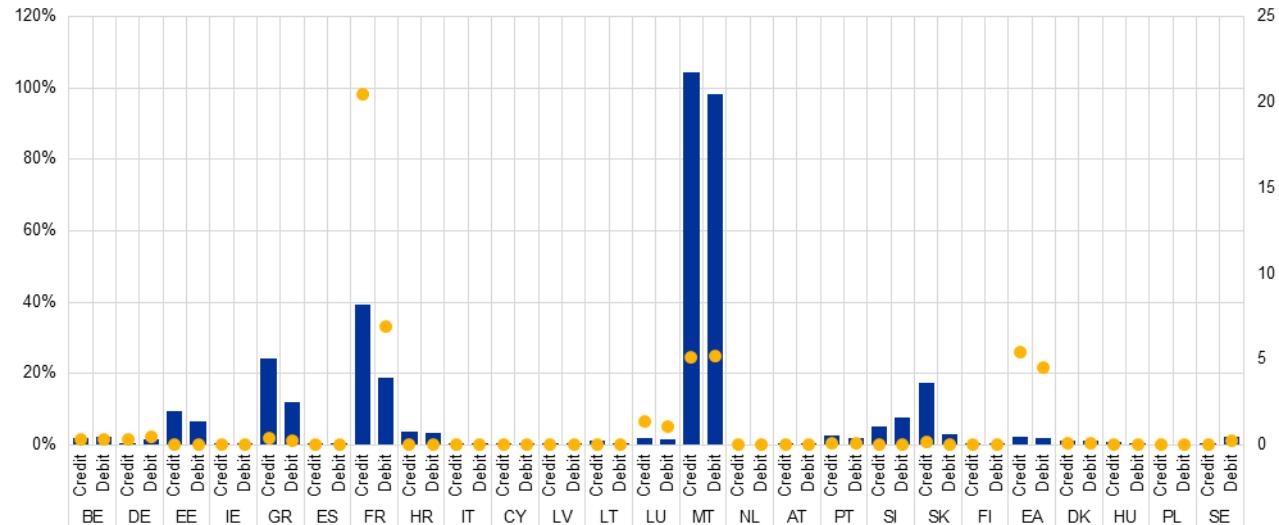

### Chart A.1.4.3

Discrepancies in primary income between the b.o.p. and the RoW account

Average as a percentage of the respective b.o.p. account item, in EUR billions (right-hand scale)

(Q3 2020 to Q2 2023)

- Relative difference (left-hand scale)
- Absolute difference in EUR billions (right-hand scale)

Source: ECB.

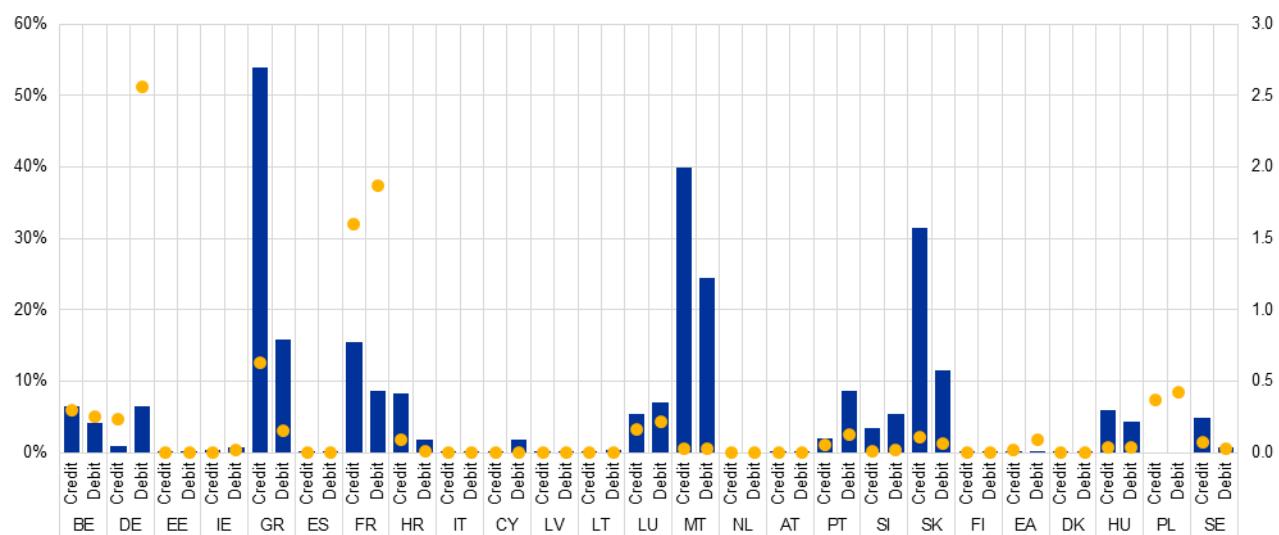

### Chart A.1.4.4

Discrepancies in secondary income between the b.o.p. and the RoW account

Average as a percentage of the respective b.o.p. account item, in EUR billions (right-hand scale)

(Q3 2020 to Q2 2023)

- Relative difference (left-hand scale)
- Absolute difference in EUR billions (right-hand scale)

Source: ECB.

## Coherence with MFI balance sheet data

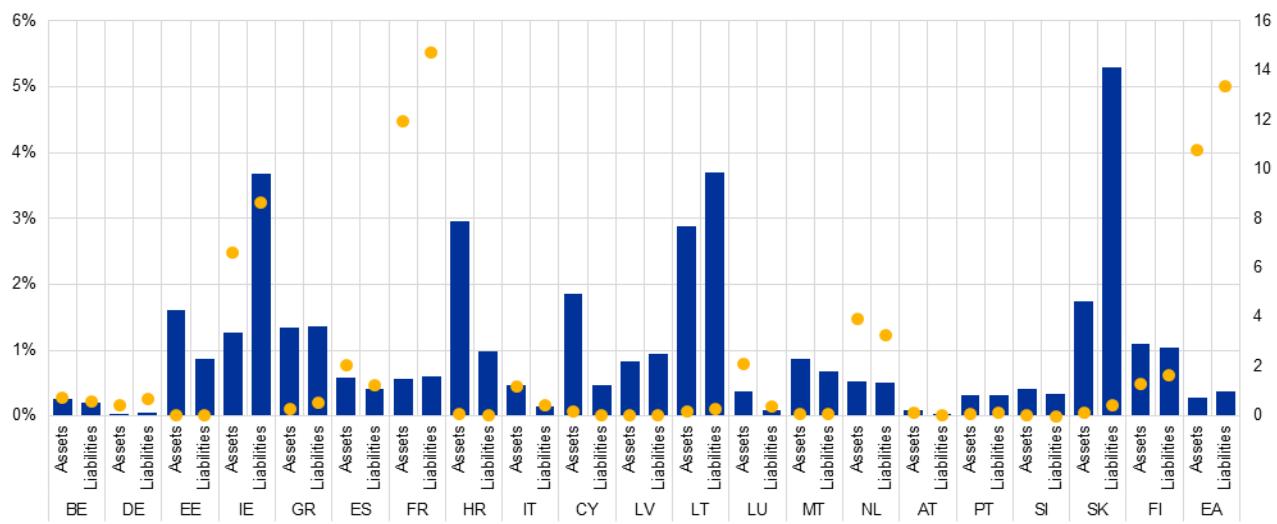

### Chart A.1.4.5

Differences between the b.o.p. (other investment) and BSI transactions (loans and deposits) – monthly data (MFI excluding the Eurosystem)

#### Percentage of the respective b.o.p. account item

(July 2020 to June 2023)

- Relative Differences (left-hand scale)
- Absolute Differences in EUR bn. (right-hand scale)

Source: ECB.

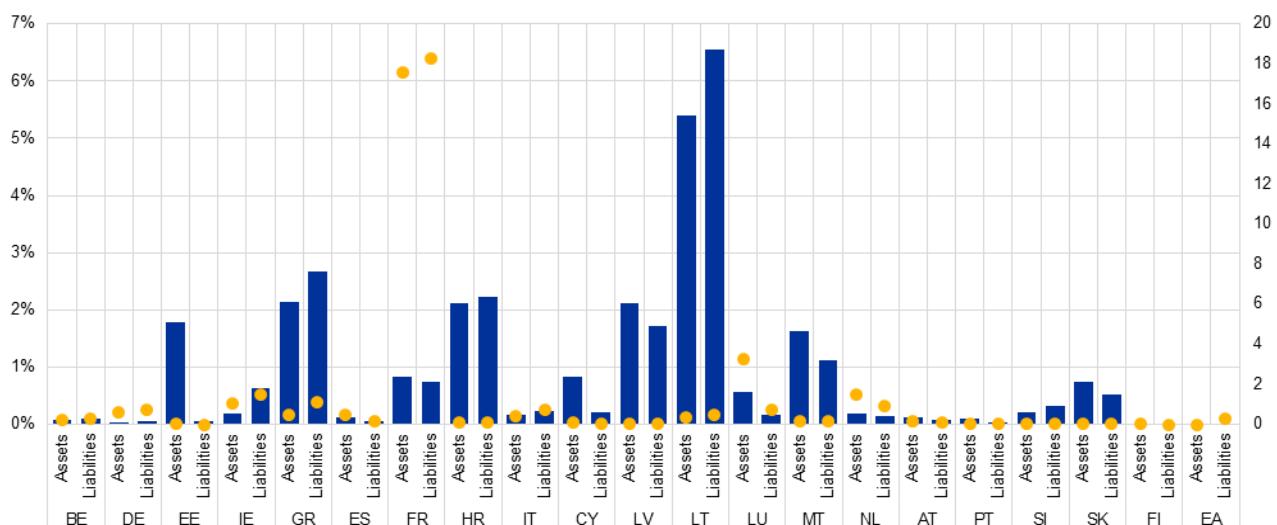

### Chart A.1.4.6

Loans and deposits transactions discrepancies between the b.o.p. and BSI – quarterly data (MFI excluding the Eurosystem)

#### Percentage of the respective b.o.p. account item

(Q3 2020 to Q2 2023)

- Relative Differences (left-hand scale)
- Absolute Differences in EUR bn. (right-hand scale)

Source: ECB.

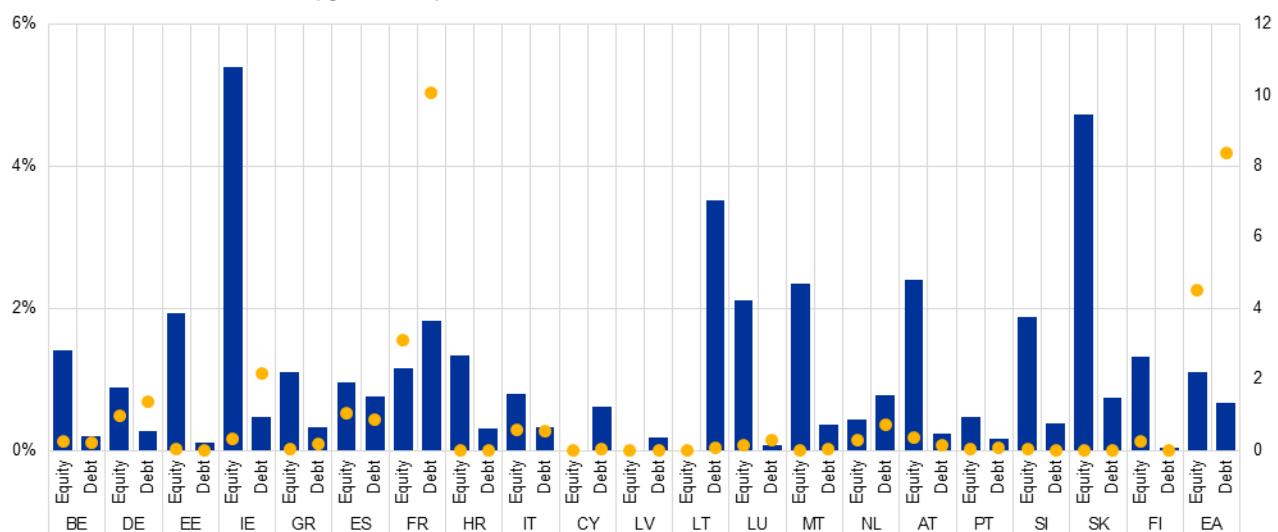

### Chart A.1.4.7

Equity and debt securities assets transactions discrepancies between the b.o.p. and BSI – monthly data (MFI excluding the Eurosystem)

Percentage of the respective b.o.p. account item

(July 2020 to June 2023)

- Relative Differences (left-hand scale)
- Absolute Differences in EUR bn. (right-hand scale)

Source: ECB.

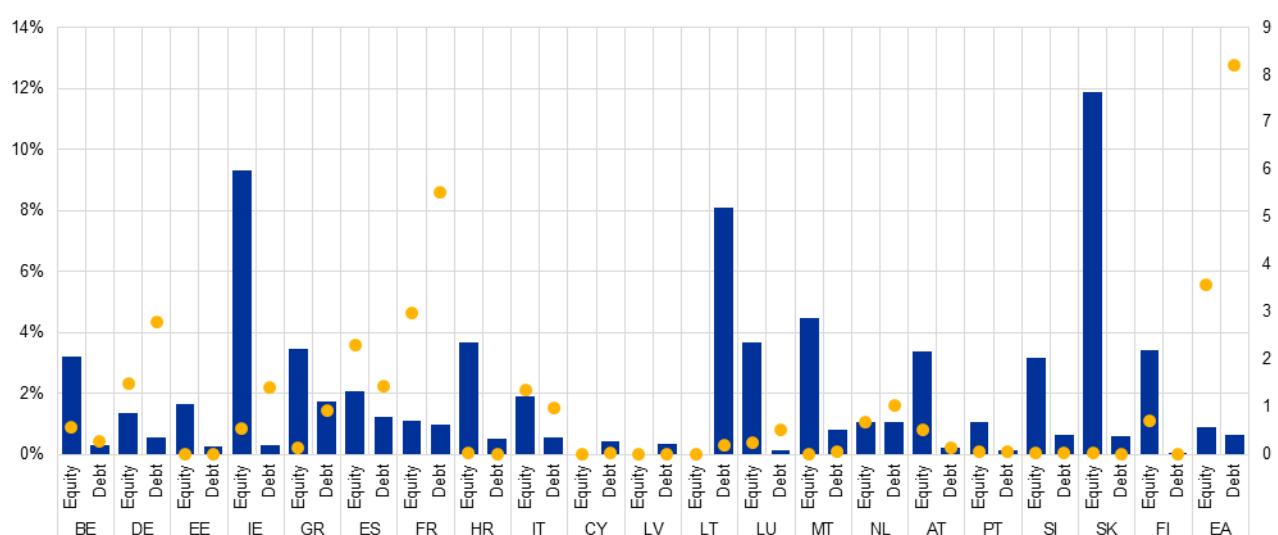

### Chart A.1.4.8

Equity and debt securities assets transactions discrepancies between the b.o.p. and BSI – quarterly data (MFI excluding the Eurosystem)

Percentage of the respective b.o.p. account item

(Q3 2020 to Q2 2023)

- Relative Differences (left-hand scale)
- Absolute Differences in EUR bn. (right-hand scale)

Source: ECB.

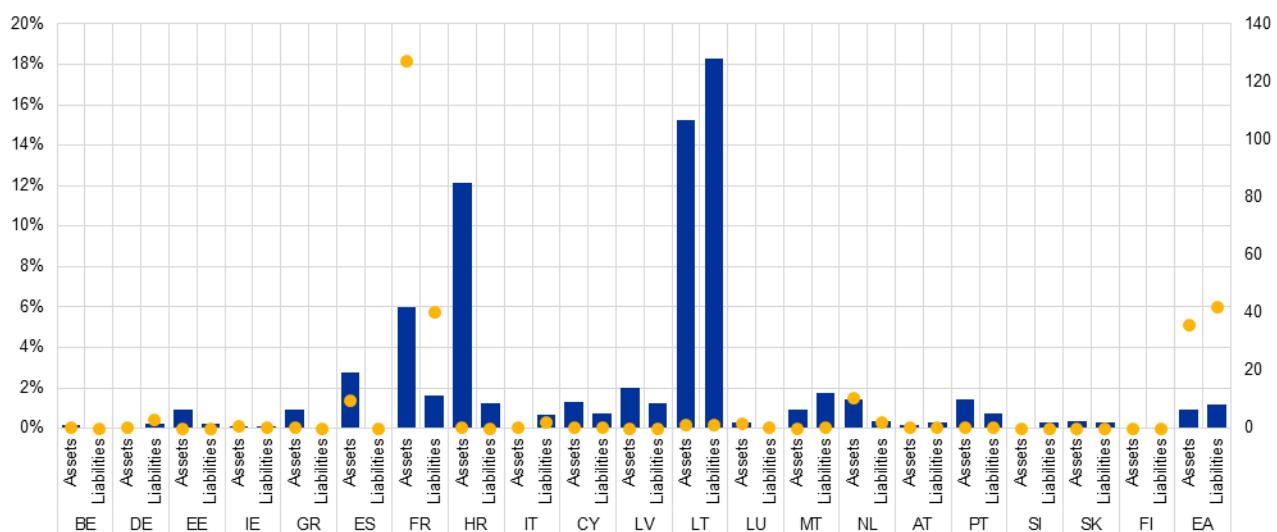

### Chart A.1.4.9

Loans and deposits positions discrepancies between the i.i.p. and BSI – quarterly data (MFI excluding the Eurosystem)

Percentage of the respective i.i.p. account item

(Q3 2020 to Q2 2023)

- Relative Differences (left-hand scale)
- Absolute Differences in EUR bn. (right-hand scale)

Source: ECB.

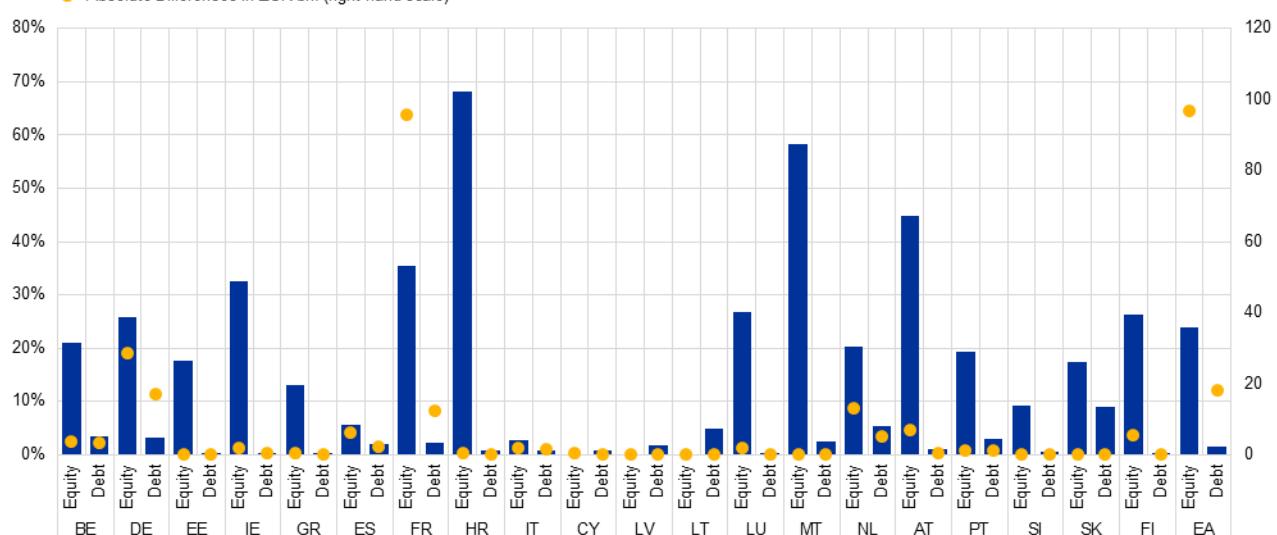

### Chart A.1.4.10

Equity and debt securities assets positions discrepancies between the i.i.p. and BSI – quarterly data (MFI excluding Eurosystem)

Percentage of the respective i.i.p. account item

(Q3 2020 to Q2 2023)

- Relative Differences (left-hand scale)
- Absolute Differences in EUR bn. (right-hand scale)

Source: ECB.

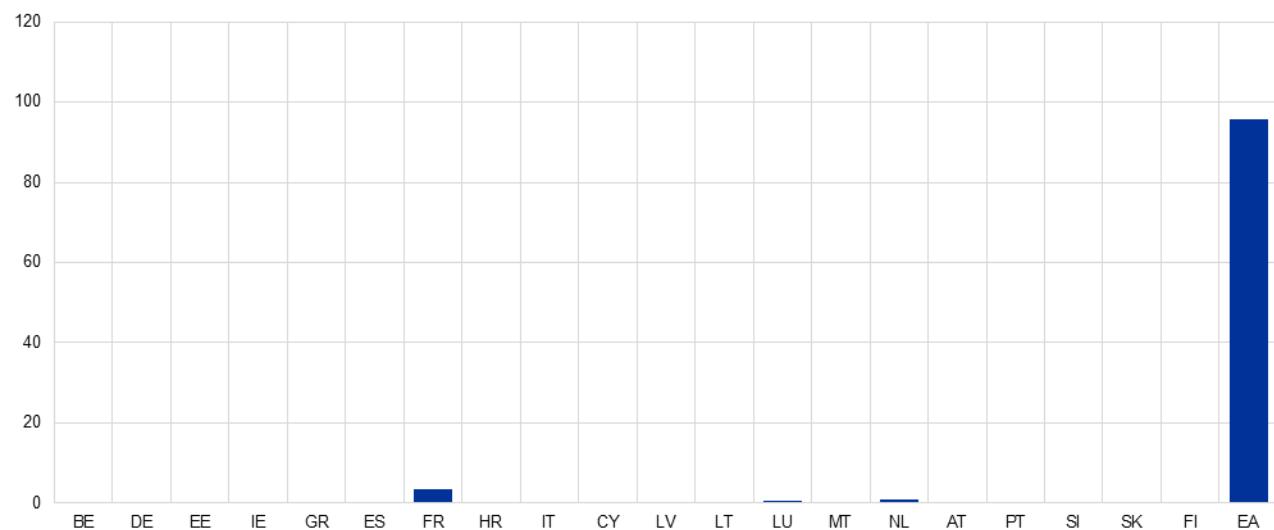

### Chart A.1.4.11

MMF shares liabilities positions discrepancies between the i.i.p. and MMF statistics

Average absolute difference in EUR billions

(Q3 2020 to Q2 2023)

■ Absolute differences in EUR bn. (right-hand scale)

Source: ECB.

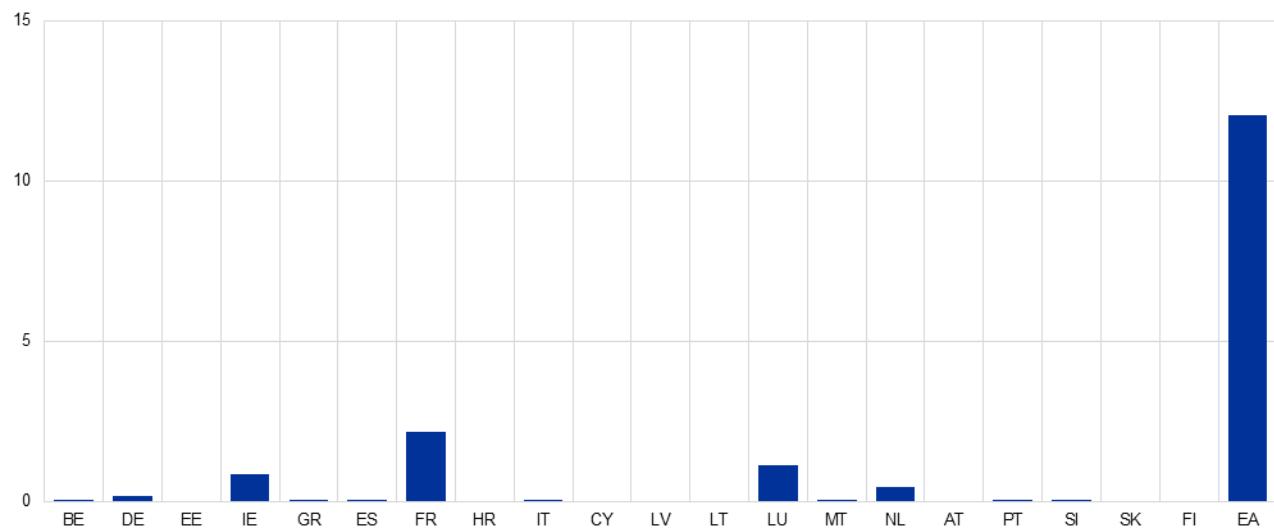

### Chart A.1.4.12

MMF shares liabilities transactions discrepancies between the b.o.p. and MMF statistics

Average absolute difference in EUR billions

(Q3 2020 to Q2 2023)

■ Absolute differences in EUR bn. (right-hand scale)

Source: ECB.

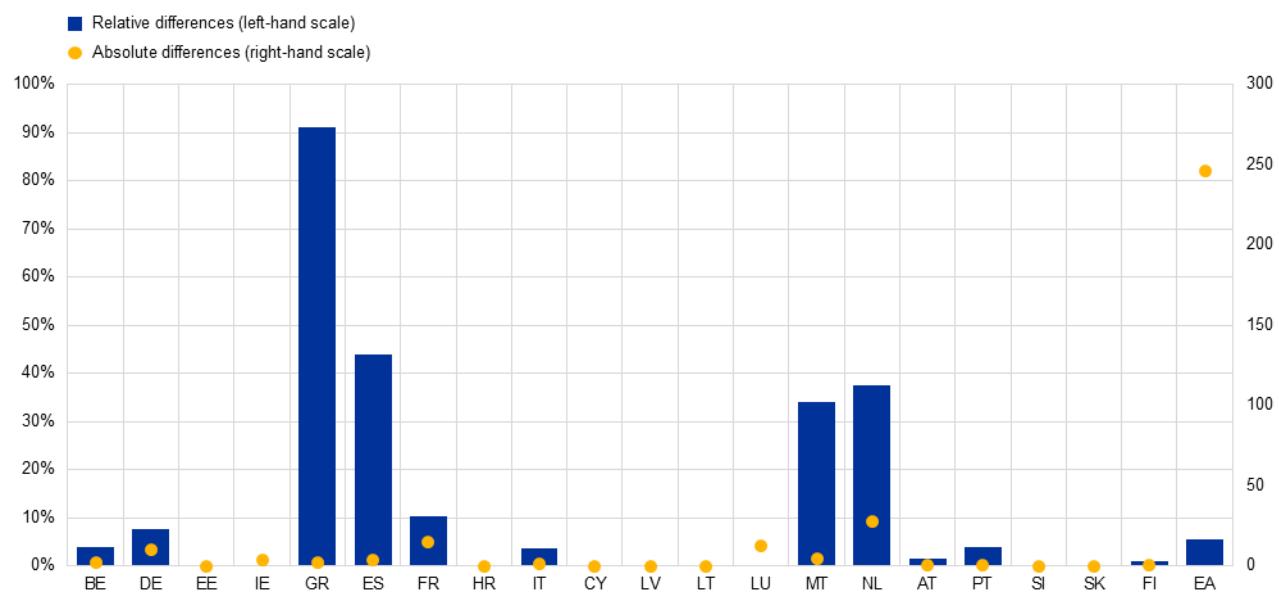

## Coherence with investment fund statistics

### Chart A.1.4.13

IVF positions liabilities discrepancies between the b.o.p. and IF statistics

As a percentage of the respective i.i.p. account item (left-hand scale), in EUR billions (right-hand scale)

(Q3 2020 to Q2 2023)

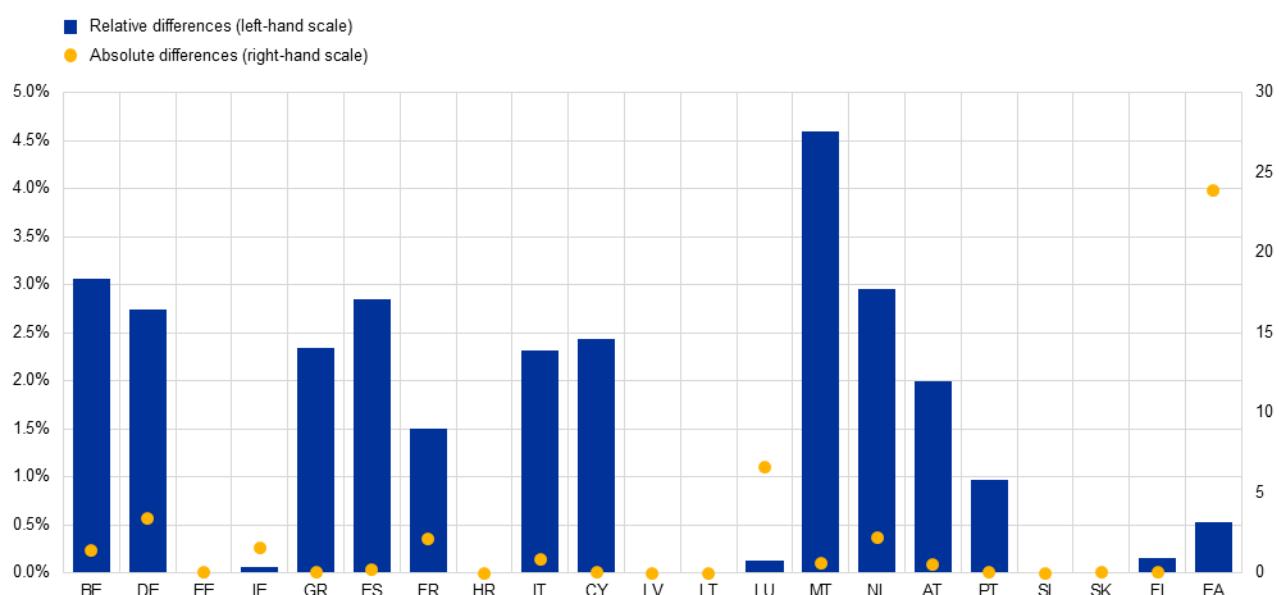

Source: ECB.

### Chart A.1.4.14

IVF transaction liabilities discrepancies between the i.i.p. and IF statistics

As a percentage of the respective b.o.p. account item (left-hand scale), in EUR billions (right-hand scale)

(Q3 2020 to Q2 2023)

Source: ECB.

## Coherence with securities holdings statistics

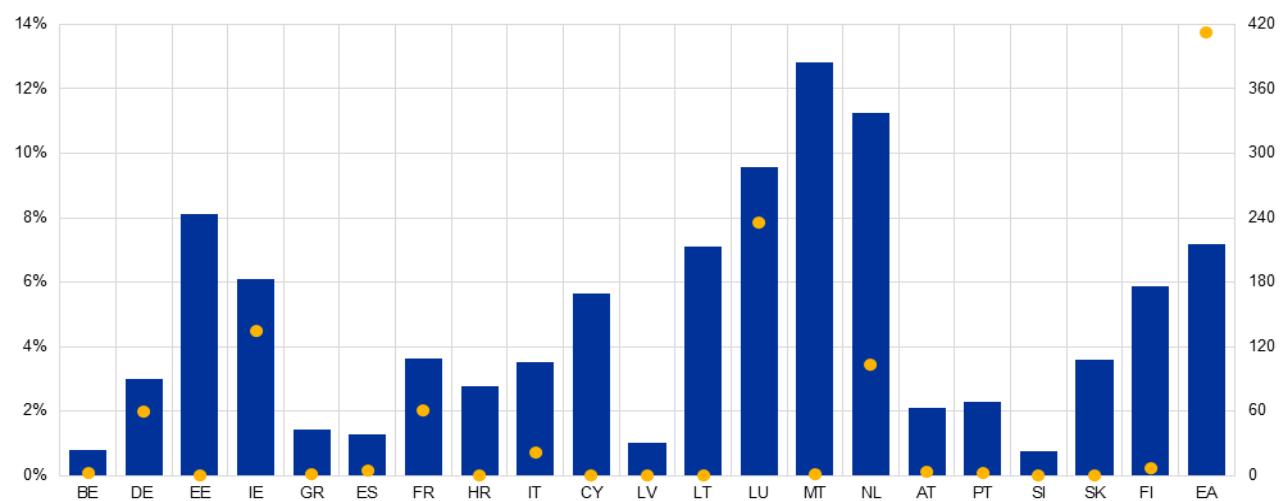

### Chart A.1.4.15

Portfolio investment debt securities positions discrepancies between the i.i.p. and SHSS statistics

Average as a percentage of the respective i.i.p. account item (left-hand scale), in EUR billions (right-hand scale)

(Q3 2020 to Q2 2023)

- Relative difference (left-hand scale)
- Absolute difference (right-hand scale)

Source: ECB.

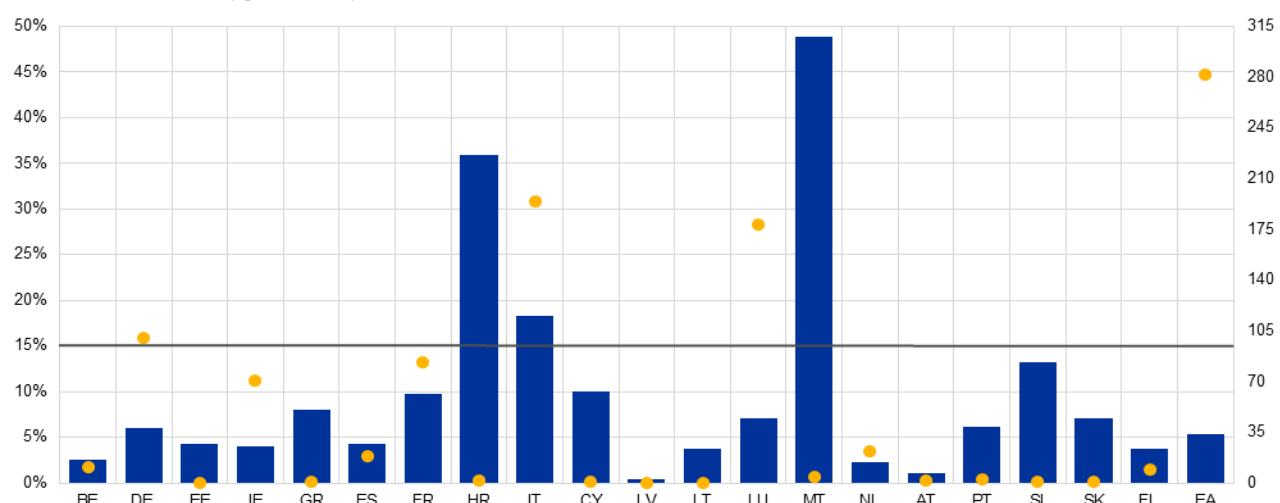

### Chart A.1.4.16.

Portfolio investment equity (listed shares and investment funds shares) positions discrepancies between the i.i.p. and SHSS statistics<sup>1</sup>

Average as a percentage of the respective i.i.p. account item (left-hand scale), in EUR billions (right-hand scale)

(Q3 2020 to Q2 2023)

- Relative difference (left-hand scale)
- Absolute difference (right-hand scale)

Source: ECB.

<sup>1</sup> The data shown for Malta refers to the period Q4 2020 to Q2 2023 and reflecting the i.i.p. data availability.

## Coherence with insurance corporation and pension fund statistics

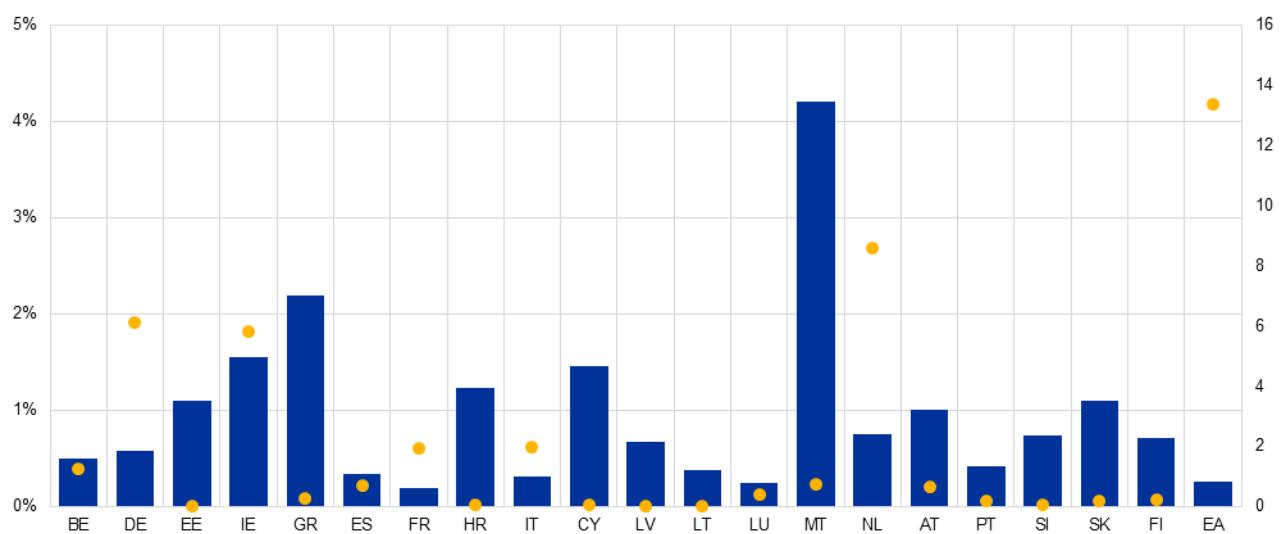

### Chart A.1.4.17

ICPF transactions assets discrepancies between the b.o.p. and IC PF statistics

Average as a percentage of the respective b.o.p. account item (left-hand scale), in EUR billions (right-hand scale)

(Q3 2020 to Q2 2023)

- Relative differences (left-hand scale)
- Absolute differences in EUR billions (right-hand scale)

Source: ECB.

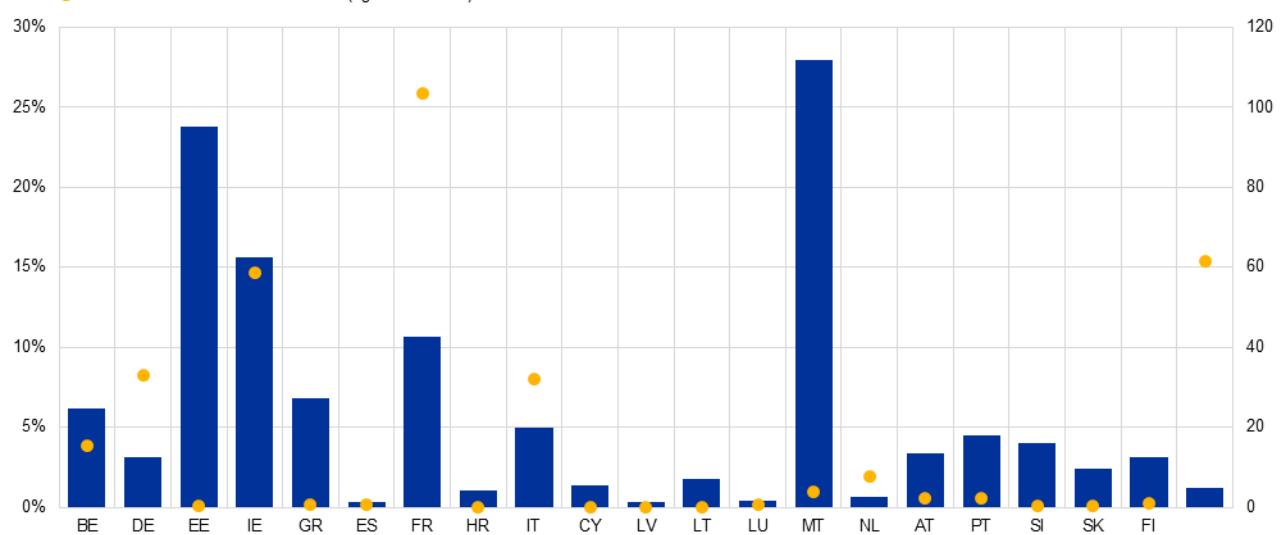

### Chart A.1.4.18

ICPF positions assets discrepancies between the i.i.p. and IC PF statistics

Average as a percentage of the respective i.i.p. account item (left-hand scale), in EUR billions (right-hand scale)

(Q3 2020 to Q2 2023)

- Relative differences (left-hand scale)
- Absolute differences in EUR billions (right-hand scale)

Source: ECB.

## Annex 2: Methodological documentation for quality indicators

### A.2.1 Data availability

#### Average completeness ratio (ACR)

The average completeness ratio (ACR) is used to assess the completeness of the data transmitted and considers the average number of reported observations per period divided by the number of total mandatory series requested, in accordance with the ECB Guideline on external statistics.

There should be a breakdown by dataset (DSET): monthly b.o.p. (MBOP), quarterly b.o.p. (QBOP), quarterly i.i.p. (QIIP) and quarterly revaluations.

$$ACR_{DSET} = \frac{\sum_{t=1}^N \text{mandatory observations transmitted } / N}{\sum_{t=1}^N \text{Total no. of observations required per dataset per period } / N}$$

where N stands for the number of periods.

As the indicator only takes into account the number of mandatory series, the target value for the indicator is 100%.

#### Average Share of free observation

Accessibility refers to the conditions under which users can obtain, use and interpret data, ultimately reflecting how easy it is for them to access the data. Data accessibility may be limited by confidentiality constraints. The indicator used to assess accessibility is the average share of observations (obs.) marked as “free for publication” per period and per dataset (DSET):

$$\begin{aligned} & \text{Average share of free obs.}_{DSET} \\ &= \frac{\sum_{t=1}^N \text{No. of obs. marked as free}}{\sum_{t=1}^N \frac{\text{No. of obs. required per dataset per period}}{N}} \end{aligned}$$

## A.2.2 Accuracy and reliability (including stability)

### Upward revisions ratio

In principle, positive and negative revisions should occur with roughly the same frequency. If the revisions are, for example, systematically positive, this may point to under-coverage in early estimates that needs to be corrected. A simple indicator for this phenomenon is the ratio between upward revisions and the number of observations considered (N).

$$\text{Upward revisions ratio} = (\# \text{ upward revisions}) / N$$

Since positive and negative revisions should occur with roughly the same frequency, around half of the revisions should be upward. The prescriptive target for this indicator is therefore between 40% and 60%.

### Directional reliability indicator

To assess whether the information on the direction of changes contained in earlier estimates has been altered by the revisions, a two-by-two contingency table may be used. In this contingency table, the columns consist of positive and negative first differences in the initial estimates (I):

$$\Delta x_{t_I} = x_{t_I} - x_{(t-1)_I}$$

The rows consist of positive and negative changes in the latest values (L):

$$\Delta x_{t_L} = x_{t_L} - x_{(t-1)_L}$$

**Table A.2.2.1**  
Contingency table for directional reliability

	$\Delta x_{t_I} > 0$	$\Delta x_{t_I} \leq 0$	<i>Subtotal</i>
$\Delta x_{t_L} > 0$	$n_{11}$	$n_{12}$	$n_{11} + n_{12}$
$\Delta x_{t_L} \leq 0$	$n_{21}$	$n_{22}$	$n_{21} + n_{22}$
<i>Subtotal</i>	$n_{11} + n_{21}$	$n_{12} + n_{22}$	$N$

The directional reliability indicator (Q) is then defined as follows:

$$Q = \frac{n_{11} + n_{22}}{N}$$

This coefficient (Q) is equal to one if the changes following the first and latest estimates always have the same sign ( $n_{11} + n_{22} = N$ ) and is equal to zero when

there is a total dissociation ( $n_{11} + n_{22} = 0$ ). Higher values of this indicator are therefore preferred.

Since revisions should not substantially alter the economic message of the first assessments, the prescriptive target for the directional reliability indicator is somewhat high at 80%. This would mean that in at least eight out of ten cases, the first assessments correctly predict the movement of the series between two consecutive observations.

### Symmetric mean absolute percentage error (SMAPE)

SMAPE is a relative size symmetric indicator. It is suitable for measuring accuracy in time series where all observations have the same sign. It is calculated as follows:

$$\text{SMAPE} = \frac{\sum_{t=1}^T |x_t^L - x_t^I|}{\sum_{t=1}^T (|x_t^L| + |x_t^I|)/T}$$

This indicator is bounded between zero and one (or 100% in percentage terms) and gives relevance to the initial observation (the forecast of initial estimates).

### Mean absolute comparative error (MACE)

As transactions in financial assets and liabilities can be positive and negative, and therefore not usable in the denominator, revisions to financial assets and liabilities can be related to the respective i.i.p. item to assess their relative size. The indicator will be expressed as  $\frac{R}{P}$ , where P is the related i.i.p. item. As for strictly positive data, an average of the absolute value of this ratio can be taken over time in order to avoid revisions of opposite signs cancelling each other out in the resulting indicator.

$$MACE_{ratio of averages} = \frac{\sum_{t=1}^T |x_t^L - x_t^I|}{\sum_{t=1}^T |p_t^L|}$$

As the i.i.p. is not available at a monthly frequency, MACE calculations for revisions to monthly b.o.p. data use the i.i.p. level at the end of the corresponding quarter.

### Net relative revisions (NRR)

For balance/net time series, revisions cannot be properly related to the series value itself because the observations may have different signs, and more importantly, the values of the series may often be close to zero. As the revision of these balance/net data cannot meaningfully be related to the size of the variable itself, alternative dimensional measures of the series must be used. To enhance understanding of the size of the revisions for the balance/net items, the revisions can be related to

average current account flows or the underlying positions of financial assets/liabilities, as applicable. These indicators are NRRs and are calculated as follows:

$$NRR_{CA} = \frac{\sum_{t=1}^T |x_t^L - x_t^I| / T}{\frac{1}{2} \sum_{t=1}^T (x_t^{L\text{credit}} + x_t^{L\text{debit}}) / T}$$

$$NRR_{FA} = \frac{\sum_{t=1}^T |x_t^L - x_t^I| / T}{\frac{1}{2} \sum_{t=1}^T (p_t^{L\text{assets}} + p_t^{L\text{liabilities}}) / T}$$

The following table shows which measures of b.o.p./i.i.p. revisions are used in the annual quality report.

**Table A.2.2.2**  
Measures of b.o.p./i.i.p. revisions

	Current account	Financial account – transactions	Financial account – positions
Credit / Assets	SMAPE	MACE	SMAPE
Debit / Liabilities	SMAPE	MACE	SMAPE
Balance / Net	NRR	NRR	NRR

### A.2.3 Internal consistency

#### Average share of satisfied validations (ASSV)

The ASSV indicator is used in this report to assess the validation rules, and can be devised for each type of validation rule as follows:

$$ASSV_{DSET}^{TYPE} = 1 - \frac{(\sum_{t=1}^N \text{Total no. of validations not satisfied} / N)}{(\sum_{t=1}^N \text{Total no. of validations to be satisfied} / N)}$$

where TYPE refers to the type of validation,<sup>2</sup> DSET to the dataset in question and N to the number of observations for the period under analysis.

Since the indicator is applied only to mandatory series, national compilers are expected to provide fully validated data, and/or explanations when the target is not met. The recommended target should therefore be 100%.

#### Average time consistency (ATC)

Consistency between monthly and quarterly datasets is normally ensured by national compilers. However, some national compilers only produce monthly data for the

<sup>2</sup> The ECB and Eurostat provide a comprehensive record of all the validations and rules that BPM6 data are subject to upon reception (see the ECB's [Booklet](#) and Eurostat's [Vademecum](#)).

compilation of euro area aggregates, usually following a simplified compilation approach (e.g. partial accrual accounting only). Therefore, in some periods, quarterly and monthly data are not necessarily fully reconciled. The ATC indicator to assess monthly/quarterly consistency should be compiled as follows:

$$ATC = 1 - \frac{\sum_{t=1}^N [Q_t - SUM(M_{t_1}, M_{t_2}, M_{t_3})] / N}{\sum_{t=1}^N |Q_t| / N}$$

where  $Q_t$  represents the quarterly value for a given item and  $M_{t_1}$ ,  $M_{t_2}$ ,  $M_{t_3}$  are the corresponding monthly observations.

For the financial account, because transactions can be zero, the indicator should use the respective position series as a denominator (similar to the MACE indicator for revisions).

As national compilers should provide fully consistent data across monthly and quarterly frequencies, the recommended target is 100%.

### Average relative explained changes (AREC)

The position/flow reconciliation equation<sup>3</sup> ensures that b.o.p. and i.i.p. data are consistent. In order to ensure comparability between countries, AREC can be expressed as a percentage of the corresponding i.i.p. item:

$$AREC = 1 - \frac{(\sum_{t=1}^N |(LE(t) - LE(t-1) + T(t) + K7A(t) + K7B(t) + KA(t))|) / N}{\sum_{t=1}^N LE(t) / N}$$

As the other changes in volume are only requested (as agreed by the WG ES and BOP WG) with the RoW (W1) as the counterpart area, reconciliation can only be performed for the RoW counterpart area.

Position/flow consistency is one of the core features of the accounting framework and a necessary condition for a quality dataset. Full reconciliation (i.e. 100%) between positions and flows should therefore be the target.

### Average relative error (ARE)

The ARE for the current account can be calculated as follows:

$$ARE(EO)_{CA} = \frac{(\sum_{t=1}^N |EO_t|) / N}{\frac{1}{2} \sum_{t=1}^N ([CA, t]_c^{W1} + [CA, t]_D^{W1}) / N}$$

where  $EO_t$  represents net errors and omissions in reference quarter t, N is the number of periods analysed (12 quarterly observations over three years),  $[CA, t]_c^{W1}$

---

<sup>3</sup>  $LE(t) = LE(t-1) + T(t) + K7A(t) + K7B(t) + KA(t)$ ; LE refers to positions, T to transactions, K7A to exchange rate changes, K7B to other price changes and KA to other changes in volume.

is the current account in reference quarter t for credit vis-à-vis the RoW (W1) and  $[CA, t]_D^{W1}$  represents the corresponding current account debit entry.

Since net errors and omissions are a residual (error) item in the b.o.p., they are expected to be relatively small and not persistently positive or negative. The ARE assesses the absolute size of the net errors and omissions in relation to the current account. The choice of target is subjective as net errors and omissions are not a direct result of the current account but of the inconsistencies between all the accounts. The prescriptive target should be the median of all EU Member States.

The ARE for the i.i.p. can be calculated as follows:

$$ARE(EO)_{i.i.p.} = \frac{(\sum_{t=1}^N |EO_t|)/N}{\frac{1}{2}\sum_{t=1}^N ([FA_{LE}, t]_A^{W1} + [FA_{LE}, t]_L^{W1})/N}$$

where  $EO_t$  represents net errors and omissions in reference quarter t, N is the number of periods analysed (12 quarterly observations over three years),  $[FA_{LE}, t]_A^{W1}$  is the i.i.p. in reference quarter t for assets vis-à-vis the rest of the world (W1) and  $[FA_{LE}, t]_L^{W1}$  represents the corresponding liabilities entry.

### Cumulative relative error (CRE)

The CRE for the current account can be expressed as follows:

$$CRE(EO)_{CA}^T = \frac{\sum_{t=1}^N EO_t}{([CA, T]_c^{W1} + [CA, T]_D^{W1})/2}$$

where  $EO_t$  represents net errors and omissions in reference quarter T, N is the number of periods analysed (12 quarterly observations over three years),  $[CA, t]_c^{W1}$  is the current account in reference quarter t for credit vis-à-vis the RoW (W1) and  $[CA, t]_D^{W1}$  represents the corresponding current account debit entry.

Likewise, this indicator can be calculated for the i.i.p. The denominator is defined as  $([FA_{LE}, t]_A^{W1} + [FA_{LE}, t]_L^{W1})/2$  in this case.

This indicator should be presented for several time periods (e.g. one year, five years, ten years) in order to show long-term behaviour and to isolate sensitivity to significant outliers.

This indicator tests the persistency of the sign of net errors and omissions or the bias. A value of zero would therefore be expected in the medium to long term. This target assumes that net errors and omissions should be a white noise process, i.e. one with a zero mean and no correlation between its values at different times. Cumulated errors and omissions should therefore tend to zero in the long run.

#### A.2.4 Asymmetries

##### Internal country geographical quality indicator (ICGQ)

The ICGQ provides information on the quality of the bilateral data. It is defined as follows:

$$ICGQ_i = \left[ w \cdot \frac{\sum_c |A_{i,c} - L_{c,i}|}{\sum_c |A_{i,c}| + \sum_c |L_{c,i}|} + (1-w) \cdot \frac{\sum_c |L_{i,c} - A_{c,i}|}{\sum_c |L_{i,c}| + \sum_c |A_{c,i}|} \right]$$

where:

i is the index of the country to which the quality index applies;

c is the index of the counterpart country;

w is a predefined weight that applies to all countries, which by default is equal to 0.5;

$\sum_c |A_{i,c}|$  reflects the sum of absolute values of the assets reported by country i (positions or transactions), broken down by counterpart country c.

Likewise,  $\sum_c |L_{i,c}|$  reflects the sum of absolute values of the liabilities reported by country i.

$\sum_c |A_{i,c} - L_{c,i}|$  measures the sum of absolute values of the bilateral asymmetries of the assets of country i vis-à-vis its counterparts.

$\sum_c |L_{i,c} - A_{c,i}|$  represents the sum of absolute values of the bilateral asymmetries of the liabilities of the same country i vis-à-vis its counterparts.

The ICGQ indicator is constrained to be within the range [0, 1], with zero being optimal and one being the worst score.

It assesses the quality of the geographical breakdown vis-à-vis each of the countries that also provide geographical information, calculating the accuracy of the geographic classification in the sample of countries where bilateral data are provided by aggregating the absolute bilateral asymmetries. Higher values could be observed even when, on balance, a country reports a correct aggregate intra-euro area estimate but would be challenged to obtain the right allocation across individual counterpart countries.

##### External country geographical quality indicator (XCGQ)

The XCGQ indicator provides information on country totals vis-à-vis the overall mirror data. It is defined as follows:

$$XCGQ_i = \left[ w \cdot \frac{|\sum_c A_{i,c} - \sum_c L_{c,i}|}{\sum_c |A_{i,c}| + \sum_c |L_{c,i}|} + (1-w) \cdot \frac{|\sum_c L_{i,c} - \sum_c A_{c,i}|}{\sum_c |L_{i,c}| + \sum_c |A_{c,i}|} \right]$$

The XCGQ indicator takes the absolute difference between the total values reported and the total available mirror data. The purpose of the XCGQ indicator is to assess how well a country's intra-EU or intra-euro area aggregate is reflected in mirror data, thus providing an indicator of the quality of a country's intra/extrabreakdown. The XCGQ indicator is constrained to be within the range [0, 1], with values close to zero being good and values close to one indicating low quality, and one component being over or underestimated vis-à-vis the other.
