

Dialogue Meeting with the ESCB The view by the industry

The view by the industry 21st June 2022 BRUSSELS, 30 October 2018 – The European Banking Federation is calling on financial sector authorities in the European Union to create an integrated and standardized framework for data reporting in order to improve the quality of data while reducing the reporting burden.

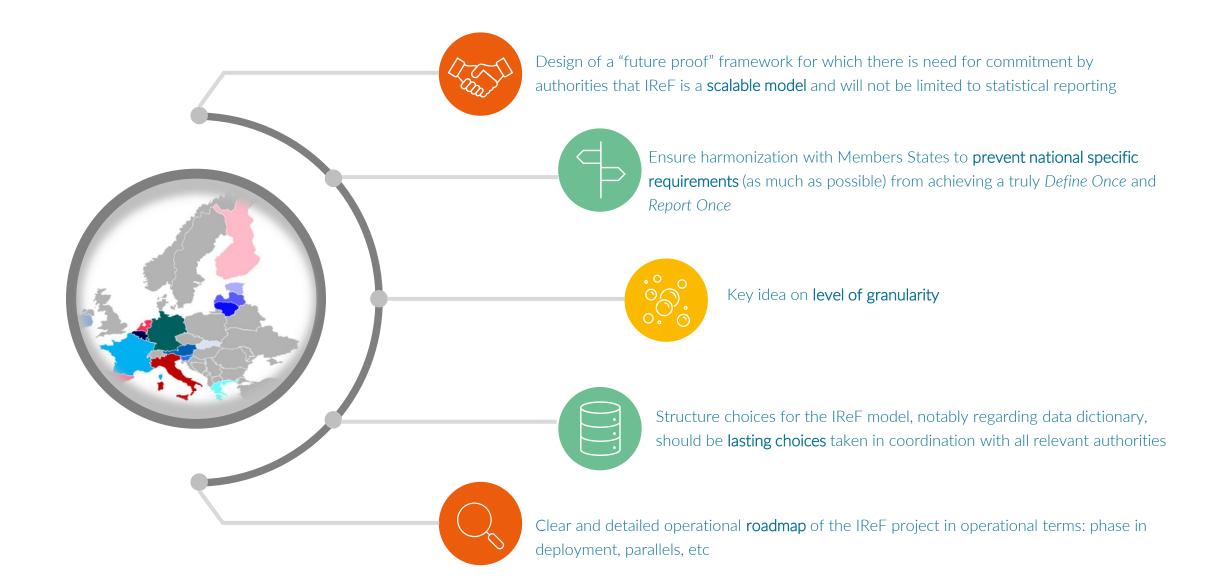

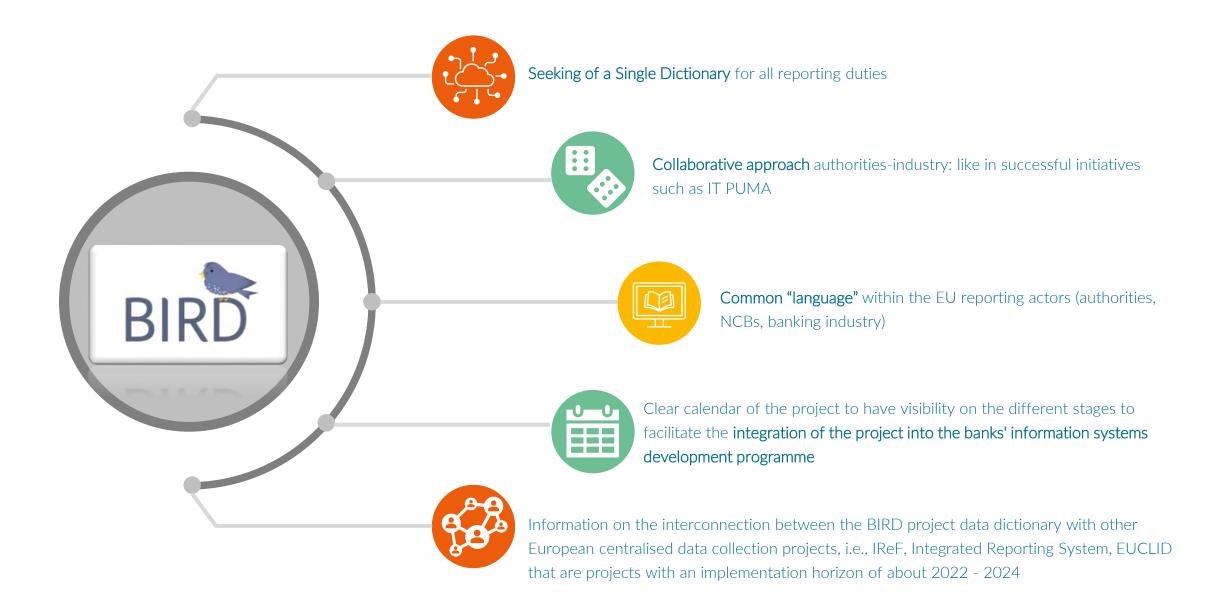

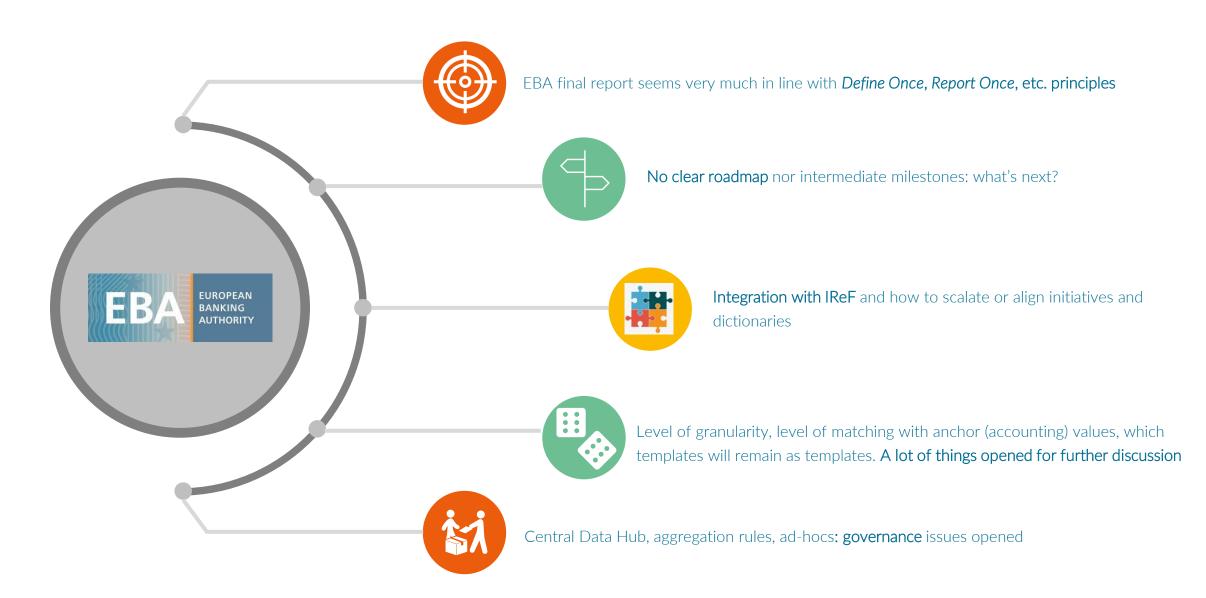

INTEGRATED REPORTING FRAMEWORK (IReF)

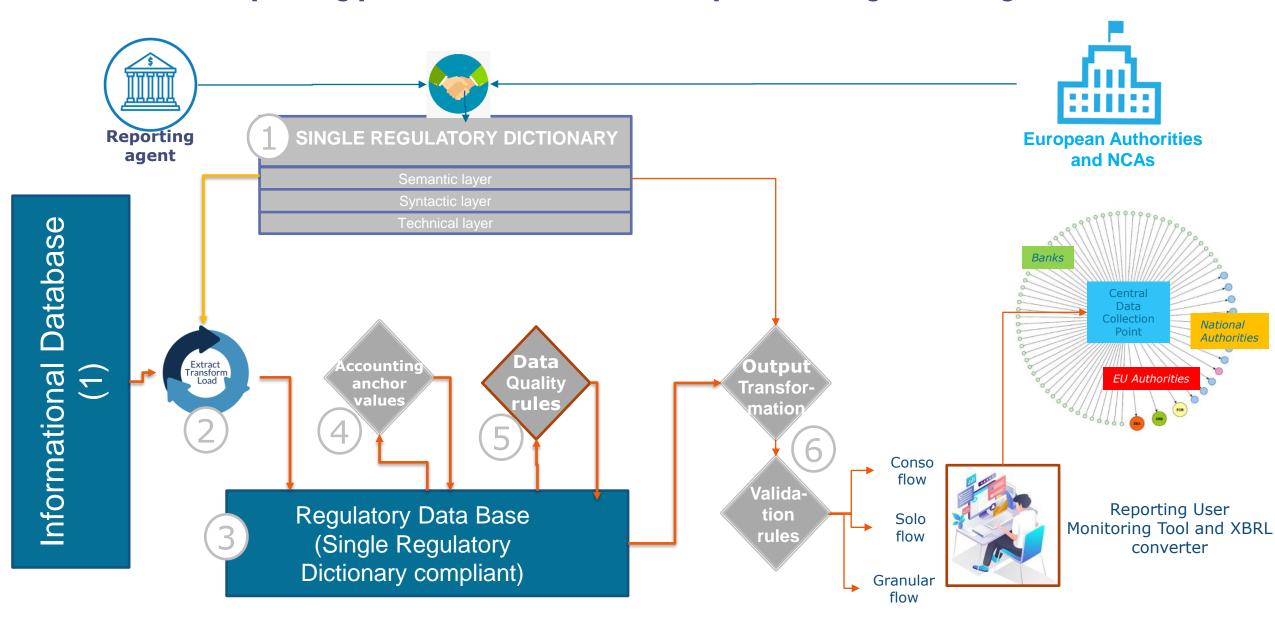

BANKS' INTEGRATED REPORTING DICTIONARY (BIRD)

INTEGRATED REPORTING SYSTEM (EBA FS)

Banks internal reporting processes must be revamped echoing this integration initiatives

Questions to be discussed

Single Regulatory Dictionary: ETL process: Base: transformation of the bank's with business, metadata and technical definitions with a LDM informational database catalogs agreed with the authorities. and LDM into SRD catalogs and LDM to create a Regulatory Data Base Includes one (or many) output compliant with SRD. layer to draw the templates and datasets and DO rules. **Design how to implement this** dictionary into bank's data architecture. Data Quality rules at different Anchor values: levels: treatment of accounting figures not internal DQ rules and authorities DQ available at granular level and rules. mismatches between accounting figures and granular (aggregated) How to implement them, how to ones. design meaningful DQi, etc.

Bank´s SRD Regulatory Data Base:

SRD morphology and catalogs with all the data needed for all the regulatory reporting.

New regulatory TDS.

SRD dictionary should include an output layer to assign attributes and figures from the step 3 *Regulatory Data Base* to templates and final datasets. Final internal validation rules for every template or dataset before sending the info/data to the authorities.

Aggregation rules and data allocation rules usable tool for reporting agents. Implementation of VRs and design last mile DQi.
